A: You just need to click on bartender setup.exe. Enter your license key and click next. You have to use old version of bartender. A: You're looking for BarTender 2020. R2 You can locate the version of BarTender by downloading the latest version from BarTender downloads page. Run BarTender Setup with the appropriate key. After the download completes, you may be asked to enter a license key, or be given an option to create your own license. Q: jQuery find element, remove it and run a function I have 2 elements that need to be removed and a function run after that. `$( ".thumbnail" ).remove(); $( ".caption" ).remove(); function populateSeoImage( $( "#myimg" ).attr( "src", image ); }` Problem is, as the image element is removed, the populateSeoImage function does not run. Is there a way I can run a function after a remove()? A: You need to delegate this event to container, like this: `$( "#mycontainer" ).on( "click", ".thumbnail", function( ) { $( this ).remove(); $( this ).find( ".caption" ).remove(); $( this ).find( ".caption" ).hide(); } );` Q: How to reset all variables and clear text fields (C#)? I am stuck and have no idea how to do this so I was hoping someone could help. What I am trying to do is to have a default text field that the user has to fill in with a certain value. When they are done I want to reset the text fields to have a blank value. A: I am assuming you do not want to use a form, but rather a single page. Option 1: Clear all controls on the page in code With a few lines of code, you can clear all controls on your page like so: `foreach (Control c in this.Controls) { c.Text = String.Empty; }` There are other ways to do this by using FindControl(). This example shows how to find all text boxes on a page by using a Linq query against the HtmlDataCollection:
